Exely Integration Guide

See also: [TESTING_GUIDE.md]

1. What This Integration Does

The Newo AI Agent integrates with Exely (hotel PMS / channel manager) so your AI can act as a hotel reservation assistant for your property.

Once connected, the AI agent can:

- check room availability for requested stay dates and guest counts
- present room options with pricing and meal plans
- create hotel reservations (two-step verify-then-create flow)
- cancel reservations with penalty calculation
- modify/reschedule reservations (date changes, room upgrades)
- look up existing reservations by confirmation number
- auto-add default hotel booking scenarios to Canvas

In plain terms: the AI can talk to guests about room availability and bookings while Exely acts as the hotel reservation backend.

Manager Quick View

Question	Short answer
What business problem does this solve?	Lets the AI handle hotel availability, booking, cancellation, modification, and booking lookup without a human agent doing those actions manually.
Who is this for?	Hotels and hospitality businesses using Exely (formerly Bnovo) as their property management system.
What is needed before setup?	Exely API credentials (Client ID + Client Secret) and the Property ID.
How long does setup usually take?	5-10 minutes if API connections are already enabled in the Exely extranet.
How do we know it worked?	`Publish All` completes successfully and `exely_access_token` is populated.
What should we test first?	Availability, then booking, then booking lookup.

Best Fit / Not a Fit

Best fit:

- hotel reservation operations via Exely
- AI-led guest conversations about room availability and bookings
- teams that want one Newo project per hotel/property

Not a fit:

- CRM-heavy workflows or lead pipeline automation
- guest recognition based only on phone number
- multi-property routing inside one Exely setup
- payment processing (not yet supported)

2. Before You Start

Make sure you have:

- access to the Newo project builder for your project
- permission to edit project settings and publish
- **API connections section** enabled in the Exely extranet (may need to request from Exely support)
- Exely API credentials (Client ID and Client Secret)
- the exact Property ID for your hotel

Who Usually Provides What

Role	Usually provides
Hotel / client team	Exely account access, Property ID, operational testing help
Exely support	API connections enablement, Client ID, Client Secret
Newo implementer / PM	Newo setup, feature toggles, publish, test plan, go-live validation

You will need these values before setup:

- **Client ID** (OAuth2)
- **Client Secret** (OAuth2)
- **Property ID**
- **Base URL** (default: `https://connect.hopenapi.com`)
- **Language Code** (default: `en`)

> ***Note:*** *The API connections section is* ***not enabled by default*** *in the Exely extranet. You must contact Exely support (`welcome@exely.com`) to enable it before you can generate API credentials.*

3. Connecting for the First Time

3.1 Enable API Access in Exely

1. Contact your Exely account manager or email `welcome@exely.com`
2. Request to enable the **"API connections"** section in your extranet
3. Wait for confirmation (typically 1-2 business days)

3.2 Create an API Connection

1. Log in to the Exely extranet at `https://secure.exely.com/app/`
2. Navigate to **Property Settings** → **API Connections**

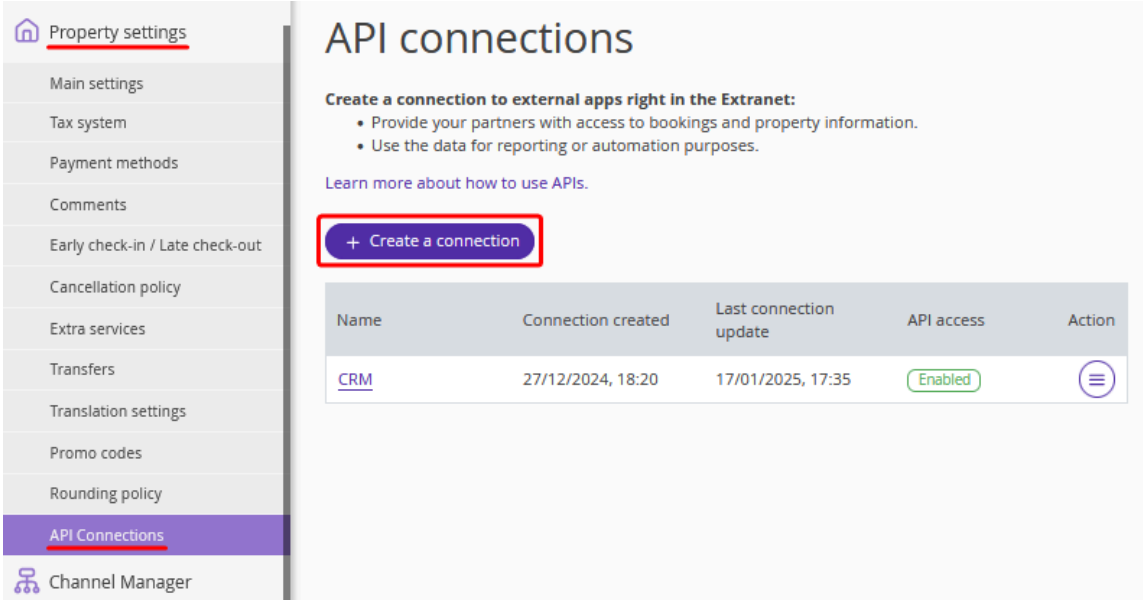

Figure 1. Navigate to API Connections in the Property Settings menu.

3. Click **"Create a connection"**

4. Enter a name (e.g., `Newo AI Integration`) and select the required APIs:

    - Content API
    - Search API
    - Reservation API
    - Read Reservation API
    - PMS Universal API v2

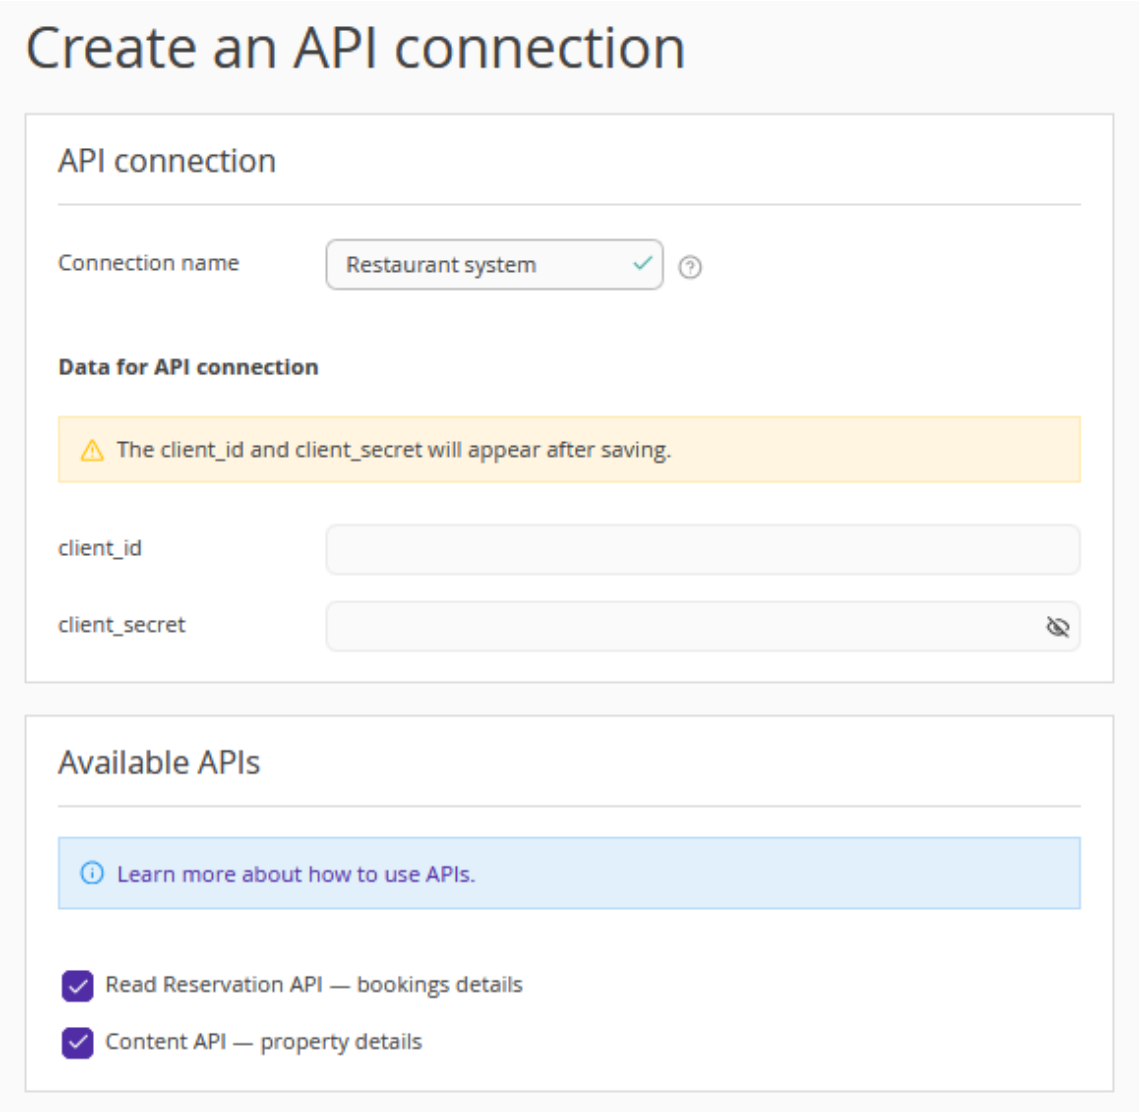

Figure 2. Enter a connection name and select the required APIs.

5. Click **"Save and enable access"**

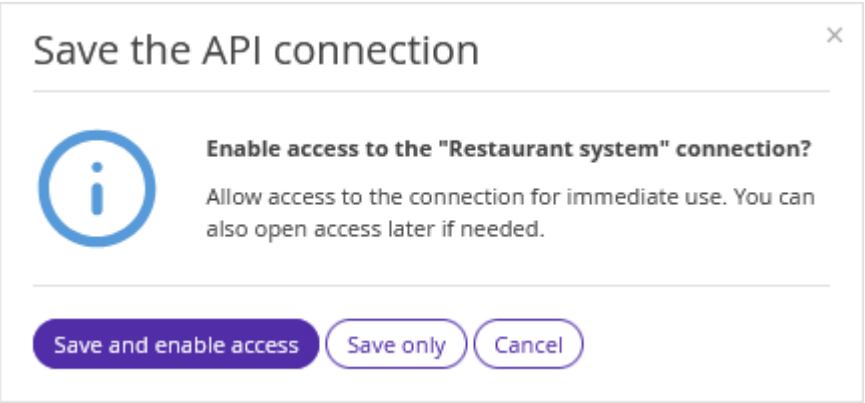

Figure 3. Choose "Save and enable access" to activate the connection immediately.

6. Copy the generated **Client ID** and **Client Secret**

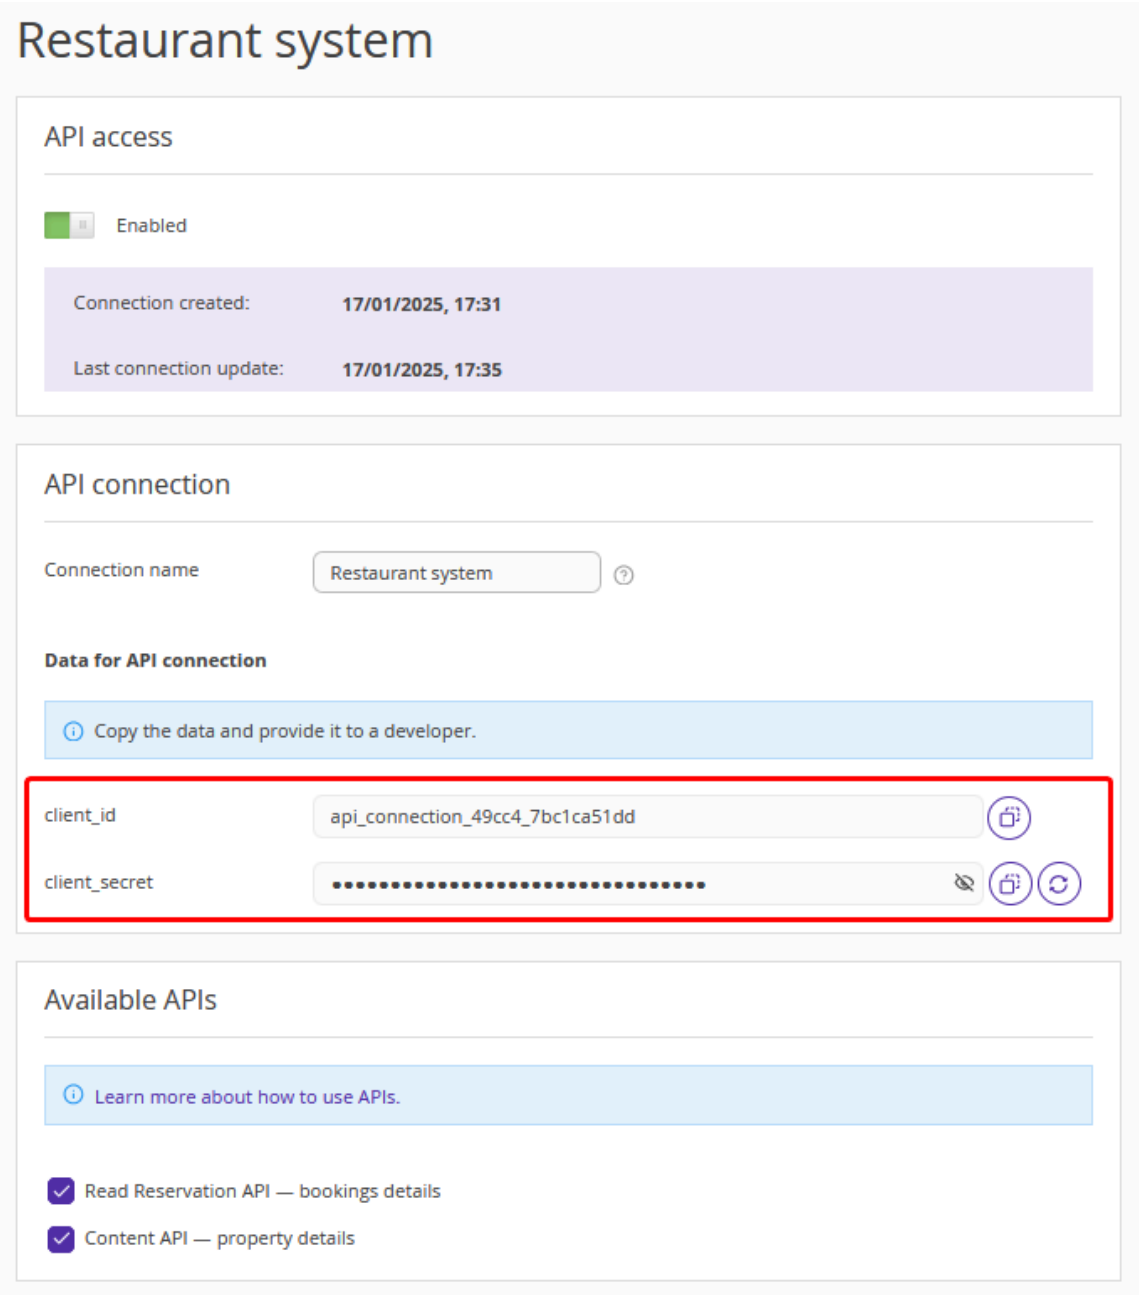

Figure 4. Copy the Client ID and Client Secret — you will need them in the Newo platform setup.

Your created connections will appear in the list:

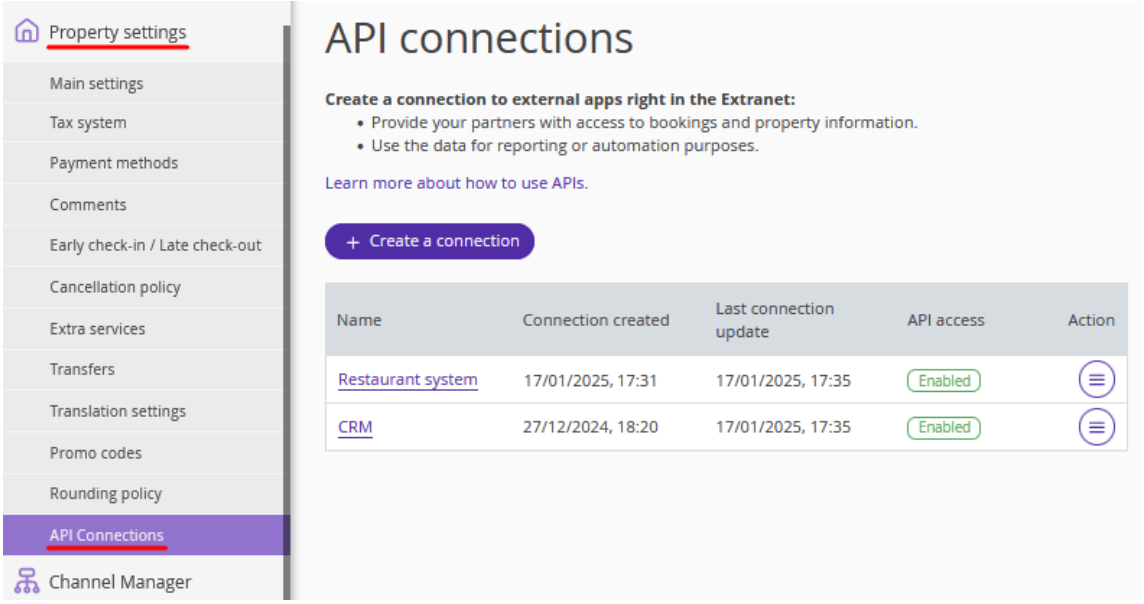

Figure 5. List of created API connections.

You can manage connections (edit, enable/disable, delete) using the action menu:

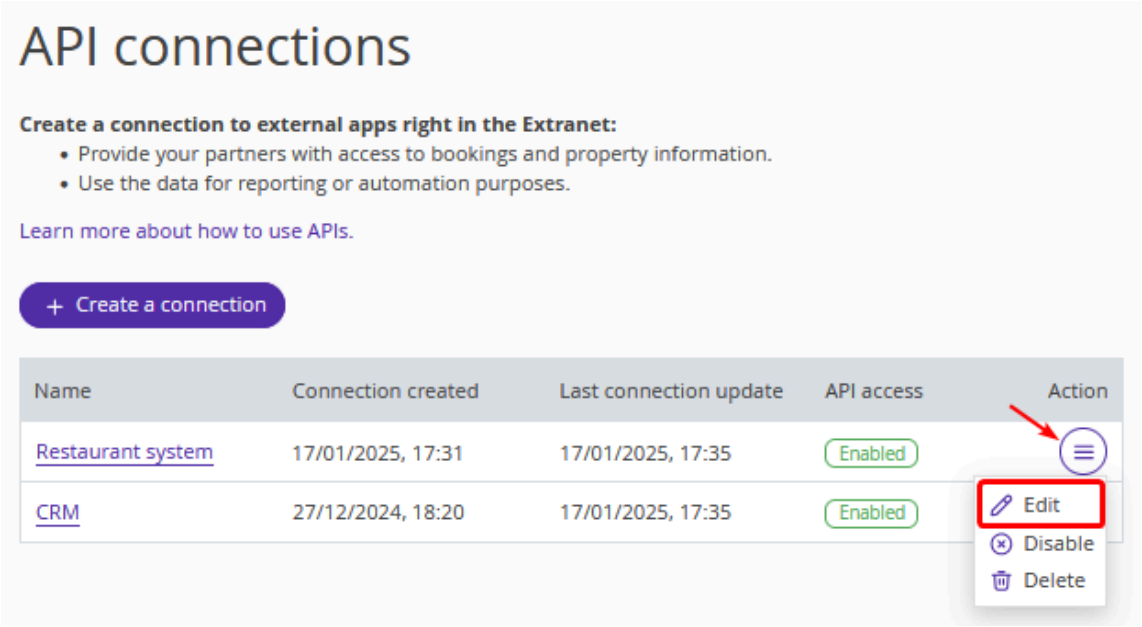

Figure 6. Connection management actions.

> ***Tip:*** *Your Property ID can be found in the extranet URL:* `https://secure.exely.com/app/Property/{PROPERTY_ID}/...` *— or ask Exely support for it.*

3.3 Configure Exely in Newo

1. Open your project in Newo.
2. Go to **Builder → Attributes**.

3. Find the **12. Exely Settings** section.
4. Fill in:
   - **01. Base URL** — `https://connect.hopenapi.com` (production) or `https://connect.test.hopenapi.com` (testing)
   - **02. Property ID** — your hotel's property identifier
   - **03. Language Code** — language for room descriptions (`en` , `ru` , `de` , etc.)
   - **04. Client ID** — OAuth2 Client ID from step 3.2
   - **05. Client Secret** — OAuth2 Client Secret from step 3.2
5. Review the feature toggles (all enabled by default):
   - **07. Enable Availability Check**
   - **08. Enable Booking**
   - **09. Enable Cancellation**
   - **10. Enable Reschedule**
   - **11. Enable Booking Lookup**
6. Click **Save**.
7. Click **Publish All**.

3.4 What Happens After Publish

When you publish:

- Newo validates the integration registry ID
- creates or updates HTTP connectors:
  - `exely_connector` (main API)
  - `exely_token_connector` (OAuth2 authentication)
- creates or refreshes the setup persona and actor
- requests an OAuth2 access token from Exely (valid 15 minutes, auto-refreshed)
- stores the token in `exely_access_token`
- registers all 5 Exely custom tools (availability, booking, cancellation, modification, lookup)
- auto-adds default hotel scenarios and intent types to Canvas

3.5 What "Successful Setup" Looks Like

After setup is complete, you should expect all of the following:

- `exely_access_token` has a non-empty value
- the project can run an availability check without authentication errors
- the Exely settings stay saved after refresh
- the booking-related tools are available to the agent
- hotel-specific scenarios and intent types appear in Canvas

4. Settings Reference

You can find all settings in **Builder → Attributes → 12. Exely Settings**.

4.1 Connection Settings

Setting	What it does	Required
01. Base URL	Root URL for the Exely Connect API	Yes (default provided)
02. Property ID	The hotel property the AI will query and update	Yes

03. Language Code	Language for room type names and descriptions	Yes (default: `en`)
04. Client ID	OAuth2 credential for API authentication	Yes
05. Client Secret	OAuth2 credential for API authentication	Yes
06. Access Token	Temporary OAuth2 token stored after setup	Auto-filled

4.2 Feature Toggles

Setting	Default	What it controls
07. Enable Availability Check	On	Allows the agent to check room availability
08. Enable Booking	On	Allows the agent to create reservations
09. Enable Cancellation	On	Allows the agent to cancel reservations
10. Enable Reschedule	On	Allows the agent to modify/reschedule reservations
11. Enable Booking Lookup	On	Allows the agent to look up reservation details by confirmation number

4.3 Technical / Advanced Settings

Setting	Default	What it does
Setup Persona ID	Auto	Persona used during setup and tool registration

5. What the AI Agent Can Do

5.1 Check Availability

The AI checks Exely availability for:

- check-in date (arrival)
- check-out date (departure)
- number of adult guests

The integration calls:

- `GET /api/search/v1/properties/{propertyId}/room-stays`
- `GET /api/content/v1/meal-plans`

What the agent receives:

- available room types with names
- rate plans with names
- meal plan information (Room Only, Bed & Breakfast, etc.)
- total pricing per room type
- checksums for booking verification

5.2 Create a Reservation

The AI can create a reservation after it has:

- stay dates (arrival + departure)
- adult count
- guest first name and last name
- guest phone number
- (optional) guest email

The integration uses a **two-step process**:

1. `POST /api/reservation/v1/bookings/verify` — validates the booking and returns a `createBookingToken`
2. `POST /api/reservation/v1/bookings` — creates the confirmed reservation using the token

On success, the agent:

- stores booking metadata in the persona `bookings` attribute (NAF standard)
- communicates the confirmation number, total price, and dates to the guest

> ***Note:*** *The `createBookingToken` is single-use and valid for 24 hours.*

5.3 Cancel a Reservation

The AI can cancel a reservation when the guest provides their confirmation number.

The integration follows a three-step process:

1. `GET /api/reservation/v1/bookings/{number}` — retrieves booking details
2. `GET /api/reservation/v1/bookings/{number}/calculate-cancellation-penalty` — calculates the penalty
3. `POST /api/reservation/v1/bookings/{number}/cancel` — cancels with the expected penalty amount

The agent communicates any penalty to the guest before proceeding.

5.4 Modify / Reschedule a Reservation

The AI can update an existing reservation by changing stay dates or room type.

The integration follows a three-step process:

1. `GET /api/reservation/v1/bookings/{number}` — retrieves current booking (including version for optimistic locking)
2. `POST /api/reservation/v1/bookings/{number}/verify` — verifies the modification is possible
3. `POST /api/reservation/v1/bookings/{number}/modify` — applies the changes

> ***Note:*** *Modification requires the booking `version` field for optimistic locking. If a 409 conflict occurs, the booking is re-fetched and the modification retried.*

5.5 Look Up an Existing Reservation

The AI can retrieve booking details when the guest provides their confirmation number.

The integration calls:

- `GET /api/reservation/v1/bookings/{number}`

The agent reads back: status, dates, room type, guest name, and total price.

5.6 Auto-Setup Canvas Scenarios

If Canvas auto-setup is enabled, Exely inserts:

- 5 hotel-specific **scenarios**: Room Booking, Cancellation, Modification, Booking Lookup, Room Availability
- 5 corresponding **intent types** that trigger the scenarios
- removes conflicting default appointment/reservation scenarios

This happens through:

- `CanvasSetupFlow`
- `SetupCanvasSkill` + `SetupLibrarySkill`

6. Supported Features

Feature	Supported	Notes
Check availability	Yes	Room types, pricing, meal plans
Create reservation	Yes	Two-step verify → create flow
Cancel reservation	Yes	With penalty calculation
Modify reservation	Yes	Date/room changes with optimistic locking
Look up reservation	Yes	By confirmation number
Recognize returning guests by phone	No	Not implemented
Payment processing	No	Planned for Phase 2
Guest check-in	No	Planned for Phase 2
Outbound reminders	No	Planned for Phase 2
Canvas auto-setup	Yes	5 scenarios + 5 intent types
Multi-property in one project	No	One `exely_property_id` per project
Webhooks from Exely	No	Exely does not support webhooks

7. Technical Architecture

7.1 Three-Layer Architecture

```
Layer 1 — Entry Flows (Availability, Booking, Cancellation, Reschedule,
ExistingClient)
    Receive ConvoAgent events, extract parameters via LLM, dispatch to Layer 2

Layer 2 — ApiFlow
    Build API requests, chain multi-step operations, route results back to Layer 1

Layer 3 — NetworkFlow
```

```
    HTTP execution via exely_connector, OAuth2 token management via
exely_token_connector
```

7.2 Trigger Events

All operations use custom Newo tools with conversation history-based parameter extraction.

Event	Source	Purpose
`exely_check_availability`	Custom tool	Check room availability
`exely_create_booking`	Custom tool	Create reservation
`exely_cancel_booking`	Custom tool	Cancel reservation
`exely_modify_booking`	Custom tool	Modify/reschedule reservation
`exely_lookup_booking`	Custom tool	Look up reservation details

7.3 Internal Events

Event	Purpose
`exely_execute_request`	Send authenticated HTTP request through NetworkFlow
`exely_result_success`	Route successful API response to ApiFlow
`exely_result_error`	Route failed API response to ApiFlow
`exely_check_availability_request`	Dispatch availability check to ApiFlow
`exely_book_slot_request`	Dispatch booking to ApiFlow
`exely_cancel_booking_request`	Dispatch cancellation to ApiFlow
`exely_reschedule_request`	Dispatch modification to ApiFlow
`exely_lookup_request`	Dispatch lookup to ApiFlow

7.4 Authentication

- **Method:** OAuth2 Client Credentials
- **Token endpoint:** `{base_url}/auth/token`
- **Token lifetime:** 15 minutes
- **Auto-refresh:** On HTTP 401, token is refreshed and request retried (max 1 retry)
- **Rate limits:** Auth endpoint: 3 req/s, 15 req/min, 300 req/hr per IP

7.5 High-Level Sequence

```
sequenceDiagram
    participant Guest
    participant ConvoAgent
    participant ExelyAgent
    participant ExelyAPI
```

```
    Guest->>ConvoAgent: Ask about rooms / booking
    ConvoAgent->>ExelyAgent: Custom tool event (exely_check_availability /
exely_create_booking / etc.)
    ExelyAgent->>ExelyAgent: Extract payload from conversation (LLM)
    ExelyAgent->>ExelyAPI: Authenticated HTTP request
    ExelyAPI-->>ExelyAgent: Room availability / booking confirmation
    ExelyAgent->>ExelyAgent: Parse result, update persona state
    ExelyAgent-->>ConvoAgent: urgent_message with result
    ConvoAgent-->>Guest: Room options / confirmation / details
```

8. How to Test That Everything Works

Before going live, run through this checklist.

Recommended Test Order

1. **Availability** — proves authentication and property targeting work
2. **Booking** — proves write access and two-step flow work
3. **Booking Lookup** — proves existing reservation retrieval works
4. **Cancellation** — proves post-booking lifecycle works
5. **Modification** — proves date/room change flow works

8.1 After Setup

After clicking **Publish All**, confirm:

- [ ] `exely_access_token` is populated (non-empty)
- [ ] no publish errors appear
- [ ] `exely_setup_persona_id` exists
- [ ] feature toggles have the intended values
- [ ] hotel scenarios appear in Canvas

8.2 Test Availability

1. Start a test conversation.
2. Ask: *"Do you have any rooms available for May 1st to May 3rd for 2 guests?"*
3. Confirm the agent says *"Let me check available rooms for you"* and returns room options with prices.

8.3 Test Booking

1. Continue from availability or start a new conversation.
2. Select a room type from the options.
3. Provide guest details when asked (name, phone, email).
4. Confirm the agent says *"I'm booking your room now"* and returns a confirmation number.

8.4 Test Booking Lookup

1. Start a new conversation.
2. Ask: *"Can you check my reservation? My booking number is [number]."*
3. Confirm the agent returns status, dates, room type, and total price.

8.5 Test Cancellation

1. Start a new conversation.

2. Say: *"I need to cancel my reservation. My booking number is [number], check-in [date]."*
3. Confirm the agent asks for confirmation, then cancels.

8.6 Test Modification

1. Start a new conversation.
2. Say: *"I need to change my booking [number] to new dates [dates]."*
3. Confirm the agent checks availability for new dates and offers to update.

9. FAQ and Troubleshooting

Why does `exely_access_token` stay empty after publish?

Check:

- Client ID and Client Secret are correctly filled in
- Base URL is correct (`https://connect.hopenapi.com` for production)
- API connection is enabled and active in the Exely extranet

Why is availability working but booking fails?

Check:

- **08. Enable Booking** is turned on
- required guest fields are present in the conversation (name, phone)
- the Exely API credentials have write permissions

Why can't the agent find my reservation?

Most commonly:

- the confirmation number format is wrong
- the booking was made in a different property
- **11. Enable Booking Lookup** is turned off

Do I need to reconnect if credentials change?

Yes. Any time you change Exely credentials:

1. Update the attributes in Newo
2. Click **Save**
3. Click **Publish All**
4. Run at least one live test

Does this integration support multiple properties?

Not in the current implementation. One project uses one `exely_property_id`. For multiple properties, create separate Newo projects.

What currency are prices displayed in?

Prices are returned in the property's configured currency in Exely (e.g., GEL for Georgia, EUR for Europe, USD for international properties).

Does Exely send webhooks for booking changes?

No. Exely does not support webhooks. Booking status is checked on-demand during conversations.

10. Manager Rollout Summary

This integration is a good fit if you want the AI to handle:

- room availability inquiries
- hotel reservation creation
- reservation changes and cancellations
- booking lookup by confirmation number

This integration is **not** currently positioned as:

- a CRM replacement
- a payment processing system
- a guest recognition system based only on caller ID

Recommended rollout order:

1. Enable API connections in Exely extranet
2. Generate API credentials
3. Configure in Newo and publish
4. Test availability
5. Test booking
6. Test lookup, cancellation, modification
7. Review Canvas scenarios
8. Go live on one hotel first

Go-Live Recommendation

For the cleanest launch:

- start with one property only
- keep all core features enabled unless there is a clear business reason not to
- run at least one real booking and one real lookup before launch day
- have a fallback human process ready for the first live shift
