

Altegio Integration Guide

What This Integration Does

The Newo AI Agent integrates with Altegio so the agent can act as an appointment assistant for businesses that manage booking in Altegio.

Once connected, the AI can:

- load Altegio services and staff into prompt context
- check public Online Booking availability
- create online bookings
- cancel or reschedule Newo-created bookings that have a stored `record_hash`
- search existing CRM appointments by phone number when B2B user authorization is configured
- publish Altegio booking and appointment-management scenarios into the Newo Canvas

Online Booking & Client Personal Cabinet v1

Authentication

Rate Limits

Public API

Authentication

Online Booking

Client Personal Cabinet

Online Booking (1.0.0)

Copy

Public API for client-facing online booking integration. This API enables third-party developers to embed online booking functionality into external platforms such as business catalogs, branded apps, and partner services. Base URL: <https://api.allegio.io/api>

Authentication

All requests require partner authorization via Bearer token in the HTTP header: `Authorization: Bearer <partner_token>`. To obtain a partner token, register in the [Allegio Marketplace](#).

Rate Limits

200 requests per minute per IP address - 5 requests per second per IP address

Authentication

User authentication and verification endpoints for online booking

Operations

POST /booking/auth

Figure S02. Official Online Booking documentation: public endpoints use partner bearer authorization.

The screenshot displays the Alteg.io developer portal for the Business Management v1 API. The main content area is titled 'Business Management (1.0.0)' and includes a 'Version Status' section with a warning icon and text stating that V1 is deprecated and V2 is recommended. Below this is the 'Authentication' section, which specifies that both partner and user authorization are required, followed by a code snippet: `Authorization: Bearer <partner_token>, User <user_token>`. The right sidebar offers various resources: 'DOWNLOAD OPENAPI DESCRIPTION' with links for openapi.json and openapi.yaml; 'OVERVIEW' with links for the license and terms of service; 'LANGUAGES' with icons for curl, JavaScript, Node.js, Python, and Java; and 'SERVERS' with links for a mock server and the production endpoint.

Figure S03. Official Business Management v1 documentation: B2B endpoints require partner plus user authorization.

Before You Start

You need:

- an Alteg.io partner token
- the Alteg.io location ID for the business branch served by this Newo project
- service and staff IDs, or confidence that the service/staff cache can resolve customer requests
- for CRM appointment lookup: an Alteg.io user token, or a user login/password that can obtain one through `/auth`
- the user must have permission to read clients and appointment records for the selected location

Public booking uses:

```
Authorization: Bearer <partner_token>
```

B2B client and appointment lookup uses:

Authorization: Bearer <partner_token>, User <user_token>

Configuration

Open **Builder -> Settings -> Module - Altego** and configure the visible fields.

Setting	Required	What it does
altego_partner_token	Yes	Authorizes public booking API calls and the partner part of B2B calls.
altego_location_id	Yes	Location used for services, staff, availability, booking, and appointment lookup.
altego_user_token	For B2B lookup	Enables direct CRM client and appointment search.
altego_user_login	Optional	Used only when Newo must call /auth to obtain a user token.
altego_user_password	Optional	Password paired with User Login for /auth. Prefer User Token when available.
altego_default_service_id	Optional	Fallback service when the caller does not name a service.
altego_default_staff_id	Optional	Fallback staff member for availability searches.
altego_feature_availability_enabled	Yes	Turns live slot lookup on or off.
altego_feature_booking_enabled	Yes	Turns booking creation on or off.
altego_feature_cancellation_enabled	Yes	Turns cancellation of Newo-created bookings on or off.
altego_feature_reschedule_enabled	Yes	Turns rescheduling of Newo-created bookings on or off.
altego_feature_existing_appointments_enabled	Yes	Turns phone-based existing appointment lookup on or off.
altego_setup_scenarios	Optional	Publishes default Altego Canvas scenarios during setup.

Hidden system fields are auto-managed by the integration: `altego_base_url` , `altego_booking_type` , cache fields, lookup date-window fields, and setup persona ID.

Appointment Search By Phone

The B2B lookup flow is:

1. Extract or receive the caller phone number.
2. If `allegio_user_token` is empty and login/password exist, call `POST /auth` .
3. Call `POST /company/{location_id}/clients/search` with `quick_search` set to the phone number.
4. Take the matched client ID.
5. Call `GET /records/{location_id}?client_id=...&start_date=...&end_date=...&with_deleted=0` .
6. Store the result in the prompt section `ExistingBookings` and persona field `allegio_b2b_appointments` .

Newo-created bookings remain in the normal `bookings` persona field. B2B records are kept separately because they often do not include the public `record_hash` required for public cancellation.

Supported API Coverage

Closed in this integration:

- `GET /book_services/{location_id}`
- `GET /book_staff/{location_id}`
- `GET /book_times/{location_id}/{team_member_id}/{date}`
- `POST /book_check/{location_id}`
- `POST /book_record/{location_id}`
- `DELETE /user/records/{record_id}/{record_hash}`
- `PUT /book_record/{location_id}/{record_id}`
- `POST /auth`
- `POST /company/{location_id}/clients/search`
- `GET /records/{location_id}`

Not covered yet:

- admin-side B2B booking creation through `POST /records/{location_id}`
- B2B cancellation/reschedule of legacy CRM records without `record_hash`
- webhooks for appointment/client changes
- v2 appointment endpoints
- marketplace lifecycle callbacks
- VoIP call lookup

Verification Checklist

After publishing:

- confirm `allegio_connector` exists and is started
- confirm **Module - Allegio** settings are saved
- start a test conversation and ask for available appointment times
- create one test booking and verify it appears in Allegio
- ask to find appointments for the same phone number
- confirm B2B lookup returns CRM appointments when User Token is configured
- confirm the AI offers human handoff instead of inventing data when B2B credentials are missing
