

Ticketon Integration

Connects **Ticketon** with the Newo AI agent so callers can search events, choose the right city, hear session details, and receive a selected event page link by WhatsApp.

Before You Start

Make sure you have:

- access to **Newo Builder** for the project, with permission to edit module settings and click **Publish All**;
- the **Ticketon connector** available in the project;
- TalkMe WhatsApp sender settings configured in the connector if you want the agent to send event links by WhatsApp.

Ticket purchase, seat selection, payment, refunds, and ticket cancellation are not handled by this integration. The agent discovers events and sessions, then hands the caller off to the Ticketon event page.

What the AI can do

- **Search Ticketon events.** The agent can search by event name, movie title, category, date phrase, and city.
- **Resolve cities before lookup.** The agent asks for a city before searching and uses Ticketon's city vocabulary to map the answer.
- **Present event options.** When several events match, the agent lists numbered choices and waits for the caller to pick one.
- **Fetch session details.** The agent reads event sessions, venue, time, language when available, price, and on-sale status.
- **Handle cinema separately.** For movies, the agent asks for a specific date before looking up sessions.
- **Send WhatsApp links.** After a selected event has an on-sale session and the caller confirms the destination phone number, the agent can send the event page link through WhatsApp.

Features at a glance

Feature	Included
Event and movie search	yes
City selection before search	yes
City vocabulary refresh on Publish All and session start	yes
Event option disambiguation	yes
Cinema session lookup by date and city	yes
Non-cinema session lookup by city	yes
WhatsApp event link delivery	yes, when TalkMe settings are configured
Ticket purchase, payment, or seat reservation	no, caller completes this on Ticketon
Refunds or ticket cancellation	no, transfer to a human

Setup

1. Prepare Ticketon and TalkMe

The Ticketon API access and TalkMe delivery credentials live in the **Ticketon connector** settings, not in the Ticketon module attributes.

For event discovery, confirm the connector has the default Ticketon settings for language and country. For WhatsApp delivery, configure the approved TalkMe sender and token before enabling link delivery for live callers.

2. Configure in Newo

1. Open the project in **Newo Builder**.
2. Find the **Module - Ticketon** settings group.
3. Keep **Enable event discovery** on when this project should answer Ticketon event questions.
4. Keep **Enable WhatsApp link delivery** on only when TalkMe delivery is configured.
5. Keep **Install Ticketon scenarios** on unless support is maintaining a custom canvas manually.
6. Click **Publish All**.

3. What Publish All does

After **Publish All**, the integration:

- creates or starts the Ticketon connector;
- registers the event search and WhatsApp link tools;
- refreshes the Ticketon city vocabulary;
- publishes the Event Discovery intent and scenario when scenario setup is enabled.

4. Values operators need to fill or choose

Most Ticketon module attributes ship with safe defaults. Operators usually only review the feature switches. WhatsApp delivery requires connector settings in addition to the module toggle.

Where	Setting name in UI	IDN / setting key	Fill or choose	Required
Module settings	Ticketon documentation	ticketon_documentation_url	Read-only support link	No
Module settings	Enable event discovery	ticketon_enable_event_discovery	Keep on to allow event/session lookup	Yes
Module settings	Enable WhatsApp link delivery	ticketon_enable_whatsapp_link_delivery	Keep on only when TalkMe is configured	No, unless WhatsApp links are expected
Module settings	Install Ticketon scenarios	ticketon_setup_scenarios	Keep on to install the shipped	No

			canvas scenario	
Ticketon connector	TalkMe API key	talkme_api_key	Paste the TalkMe token from the approved sender account	Yes for WhatsApp delivery
Ticketon connector	TalkMe source	talkme_source	Choose or enter the approved TalkMe WhatsApp sender/source	Yes for WhatsApp delivery

How to test that everything works

Test event discovery

1. Ask the agent: "Find concerts in Almaty this weekend."
2. The agent should ask for the city only if it was missing, then say a short immediate promise in the user's language whose meaning is: *"I will look for matching event options now."*
3. The agent should return event options or session details from Ticketon, not answer from general knowledge.

Test cinema sessions

1. Ask the agent: "What time is this movie showing in Astana?"
2. If the date is missing, the agent should ask for the preferred date.
3. After the date is provided, the agent should say a short immediate promise in the user's language whose meaning is: *"I will look for matching event options now."*
4. The agent should present movie sessions for the selected city and date.

Test WhatsApp link delivery

1. Complete an event lookup until the agent presents sessions and offers to send the link.
2. Ask it to send the link by WhatsApp.
3. Provide and explicitly confirm a full destination phone number.
4. The agent should say the WhatsApp send code-phrase in the user's language: *"Give me a moment to send the event link to WhatsApp right now. I'll get back to you shortly."*
5. The agent should confirm delivery only after the delivery result is available.

Scenarios

The integration ships with one editable scenario on the canvas.

What gets added on Publish All

Intent	Scenario
Event Discovery	Event Discovery

These are a **reference implementation**. You can edit wording, add clarifying questions, and adjust tone in the canvas UI.

Updates do not overwrite your edits. Once you edit a scenario or intent in the canvas, future updates of this integration will not replace your edited copy. To pull newer shipped defaults later, delete the edited copy and run **Publish All** again.

Why trigger phrases matter

The scenario contains required code-phrases the agent must say at specific steps in the user's language. Those code-phrases trigger the integration tools. If you edit the scenario, preserve the required meaning and phrase-only behavior.

Scenario 22 - Event Discovery

Runs when the caller asks about Ticketon events, movies, concerts, theatre, circus, sports, museums, master classes, session times, venues, prices, or WhatsApp delivery of the selected event link.

1. Critical step: ask what event, movie, show, or category the caller is looking for.
2. Critical step: ask which city to search in before lookup if the caller did not already name one.
3. Critical step: trigger event discovery with a short immediate promise in the user's language whose meaning is: *"I will look for matching event options now."*
4. Wait for the event lookup panel and react to its state: loading, options, needs date, needs city, unavailable, no sessions, success, or error.
5. If the caller wants WhatsApp delivery, confirm that the selected event has a link and on-sale sessions, collect and confirm the destination phone number, then trigger delivery with the WhatsApp send code-phrase: *"Give me a moment to send the event link to WhatsApp right now. I'll get back to you shortly."*

Triggered by intent: Event Discovery.

Trigger code-phrases (preserve required meaning and phrase-only behavior):

- *"I will look for matching event options now."* - fires event discovery and session lookup when said as a short immediate promise in the user's language.
- *"Give me a moment to send the event link to WhatsApp right now. I'll get back to you shortly."* - fires WhatsApp link delivery when said in the user's language.

What the agent reads to know the result:

- **Ticketon cities panel** - city vocabulary refreshed from Ticketon; used to map caller city names to stable city codes and ids.
- **Event lookup panel** - current event lookup, selected event options, required next detail, sessions, event link, WhatsApp sending state, or error.

Safe customization:

- Change greeting, tone, and language around the trigger code-phrases.
- Add business-specific transfer wording for unsupported purchase, refund, or cancellation requests.
- Do not add city names, event titles, links, explanations, or questions to either code-phrase.
- Do not remove the city step before event discovery.
- Do not promise ticket purchase or seat reservation.

Trigger phrases reference

Phrase	Fires	Prompt panel	Main states
<i>"I will look for matching event options now."</i>	Event discovery and session lookup	Event lookup panel	loading, options, needs_date, needs_city, unavailable, no_sessions, success, error
<i>"Give me a moment to send the event link to WhatsApp right now. I'll get back to you shortly."</i>	WhatsApp link delivery	Event lookup panel	whatsapp_sending, whatsapp_ready, error

Prompt state reference

Prompt panel	Written by	Important states	How the scenario should react
Ticketon cities panel	City cache refresh	ready	Use it as vocabulary for city extraction. Do not list many cities unless the caller asks.
Event lookup panel	Event discovery	loading	Wait and tell the caller briefly that options are being checked.
Event lookup panel	Event discovery	options	Present numbered options and ask which event the caller means.
Event lookup panel	Event discovery	needs_date	Ask for the preferred date, then trigger event discovery again.
Event lookup panel	Event discovery	needs_city	Ask for the city, then trigger event discovery again.
Event lookup panel	Event discovery	unavailable	Explain the selected event is not currently available and offer another event, date, city, or transfer.
Event lookup panel	Event discovery	no_sessions	Tell the caller no active sessions were found and offer another date, city, or event.
Event lookup panel	Event discovery	success	Present event and sessions. Offer WhatsApp only when an event link exists and seats are available.
Event lookup panel	WhatsApp delivery	whatsapp_sending	Wait for delivery confirmation. Do not send a second message.
Event lookup panel	WhatsApp delivery	whatsapp_ready	Confirm the link was sent when the result says it was sent.
Event lookup panel	Any feature	error	Follow the recovery instruction, ask for one missing detail, offer another lookup, or offer transfer.

FAQ

Q. Does the agent buy tickets? No. It gives event/session information and can send the Ticketon event page link. The caller completes purchase on Ticketon.

Q. Why does the agent ask for a city before search? Ticketon search and session lookup are city-sensitive. The city lets the integration pass the right location filter and session city id.

Q. Why does cinema need a date? Movie sessions are date-scoped. The agent asks for a date before retrieving cinema sessions.

Q. Can WhatsApp delivery work without TalkMe settings? No. The module toggle only enables the feature in Newo. The connector still needs the TalkMe API key and approved sender/source.

Q. What happens if the city cache is empty? The agent still asks for the city. The session lookup will try to resolve the spoken city through the connector and will ask again if it cannot resolve it.

Common errors and recovery

The agent does not run event search after the scenario was edited

Likely cause: the event discovery code-phrase was changed, extended with extra text, or removed.

How to recover:

1. Open the Event Discovery scenario on the canvas.
2. Restore the event lookup promise meaning: *"I will look for matching event options now."*
3. Click **Publish All**.

How to verify: ask for an event again; the event lookup panel should move to loading, options, success, or a recovery state.

WhatsApp link is not sent

Likely cause: TalkMe settings are missing, the selected event has no on-sale sessions, the event link is missing, or the phone number was not explicitly confirmed.

How to recover:

1. Confirm **Enable WhatsApp link delivery** is on.
2. Confirm the connector has `talkme_api_key` and `talkme_source` configured.
3. Run an event lookup until the event lookup panel is in success with an event link and available seats.
4. Ask for WhatsApp delivery again and confirm the full phone number.

How to verify: the event lookup panel should move through whatsapp_sending to whatsapp_ready.

The agent keeps asking for city

Likely cause: the city name did not resolve to a Ticketon city id.

How to recover:

1. Ask the caller for a more specific city name.
2. Use a major Ticketon city name when testing, such as Almaty or Astana.
3. Click **Publish All** if the city vocabulary was not refreshed recently.

How to verify: the next lookup should proceed to event options or sessions instead of needs_city.

Limitations

- Ticket purchase, payment, seat selection, refunds, and ticket cancellation are outside the integration.
- WhatsApp delivery sends the event page link, not a ticket or payment link generated by Newo.
- Session lookup uses the connector `list_sessions` dispatcher for both cinema and non-cinema events.
- One lookup uses one Ticketon city at a time.

All settings reference

Every setting below either appears in the **Module - Ticketon** group or is a Ticketon connector setting needed for a feature. The **IDN / setting key** column is the technical name admins use in API calls, logs, and advanced views.

Name in UI	IDN / setting key	Where to edit	Description	Required
Ticketon documentation	<code>ticketon_documentation_url</code>	Module settings	Read-only setup/support reference.	No
Enable event discovery	<code>ticketon_enable_event_discovery</code>	Module settings	Enables Ticketon event search, city resolution, event details, and session lookup. Code-phrase meaning: "I will look for matching event options now." Prompt state: Event lookup panel.	Yes
Enable WhatsApp link delivery	<code>ticketon_enable_whatsapp_link_delivery</code>	Module settings	Enables WhatsApp delivery of the selected event link after availability and phone confirmation. Code-phrase: "Give me a moment to send the event link to WhatsApp"	No

			right now. I'll get back to you shortly." Prompt state: Event lookup panel.	
Install Ticketon scenarios	ticketon_setup_scenarios	Module settings	Installs the Event Discovery intent and scenario during Publish All.	No
Cities cache	ticketon_cities_cache	Auto-managed module setting	Cached Ticketon city vocabulary. Prompt state: Ticketon cities panel ready.	No
Cities cache updated at	ticketon_cities_cache_updated_at	Auto-managed module setting	Timestamp of the last successful city cache refresh.	No
Ticketon setup persona	ticketon_setup_persona_id	Auto-managed module setting	Internal persona used to register tools.	No
TalkMe API key	talkme_api_key	Ticketon connector	Token used by TalkMe WhatsApp delivery.	Yes for WhatsApp
TalkMe source	talkme_source	Ticketon connector	Approved TalkMe WhatsApp sender/source.	Yes for WhatsApp
TalkMe base URL	talkme_base_url	Ticketon connector	TalkMe service base URL.	No
Accept language	accept_language	Ticketon connector	Preferred Ticketon API language.	No
Country code	country_code	Ticketon connector	Ticketon country scope.	No

Changelog

0.1.9 - Session-start event binding

- City cache refresh on session start now listens without a `system / system` connector binding.

0.1.8 - City cache flow

- City vocabulary refresh now lives in a dedicated CityCache flow.
- City cache refresh listens to **session_started** and **project_publish_finish** only.
- Removed legacy **conversation_started** city-cache subscriptions.

0.1.7 - Settings group label

- Settings now appear under **Module - Ticketon** in Newo Builder.

0.1.6 - City-aware event discovery

- City vocabulary refresh runs on Publish All and session start.
- Event search includes the resolved city code as the location filter.
- Session lookup asks for city when it cannot resolve a city id.
- Documentation now lists trigger phrases, prompt states, UI setting names, and idns.
