

TrackB Integration

What the AI can do

Summary

TrackB Integration connects the **TrackB delivery tracking service** with the **Newo Platform**.

It enables:

- Automatic delivery status lookup by tracking number during a conversation
- Strict, facts-only responses — the agent never guesses or infers delivery status
- Auto-provisioning of a delivery lookup scenario to the workflow canvas

This integration is designed for **e-commerce businesses and logistics companies** who need their AI agent (voice or chat) to answer customer questions about shipment status in real time.

Common use cases

- When a client asks "Where is my package?" → Agent extracts the tracking number and checks the TrackB API, then reads back the exact delivery status
- When the tracking number is missing → Agent asks the client to provide it exactly as shown in the shipment confirmation
- When the tracking API returns no data → Agent tells the client there is no information for that tracking number (no guessing)
- When the project is published → Delivery lookup scenario and intent type are automatically added to the workflow canvas

Features at a glance

Feature	Supported	Notes
Delivery Status Lookup	✓	Real-time query to TrackB API by tracking number
Tracking Number Extraction	✓	LLM-powered extraction from conversation context
Empty / Not Found Handling	✓	Explicit message when no data is found — no speculation
API Error Handling	✓	Explicit message when TrackB API is unavailable
Canvas Scenario Provisioning	✓	Auto-adds Delivery Status Lookup scenario and intent to canvas
Multiple Tracking Numbers	✗	One lookup per conversation turn
Proactive Status Notifications	✗	On-demand only; no outbound calling for delivery updates
Custom Tracking Providers	✗	Hardwired to TrackB (track.pasts.lv); no other carriers supported

Before You Start

Before installation:

- Active **Newo Platform** account with an AI agent project
- Access to the **TrackB** service (track.pasts.lv) — the API token is pre-configured in the integration

No external API keys are required from the customer — the integration uses a built-in access token.

Setup

Create the Newo project

If this project already exists in **Newo Builder**, skip this subsection and continue with the integration-specific settings below.

1. In **Newo Builder**, open the projects list and click **Create Project** (or **Create New Project** from the top-right menu).

 Create New Project menu in Newo Builder

2. Fill **IDN** and **Title**. The exact names do not matter; use any clear names your team will recognize.
3. In **Registry**, choose the release channel:
 - **staging** — the newest module fixes appear here first. Use it when you need the latest fix, but expect possible unfinished changes.
 - **production** — the final stable version for live projects.
4. In **Module**, select the module for this integration.

 Create Project form showing IDN, Title, Registry, and Module fields 5. Leave **Module version** on **Latest version** unless support tells you to pin a specific version, then click **Create**.

3.1 Step 1 — Add the Integration to Your Project

1. Open **Newo → Projects** and select your project
2. Navigate to **Builder / Integrations**
3. Find **TrackB** in the list and click **Add**
4. Click **Save + Publish All**

On publish, the integration automatically:

- Registers the delivery status lookup tool with the ConvoAgent
- Creates the necessary connection
- Sets up all required attributes with default values

3.2 Step 2 — Configure Attributes (Optional)

Navigate to **Builder / Attributes** → section **12. TrackB Settings**.

Attribute	Default	Description
trackb_setup_scenarios	True	If enabled, automatically adds the Delivery Lookup scenario and intent to the workflow canvas on publish
trackb_override_agent_attributes	True	If enabled, applies default TrackB configuration to the ConvoAgent on setup

These settings are optional — the integration works out of the box with defaults.

3.3 Step 3 — Verify Canvas Setup

After publishing:

1. Open **Builder / Canvas** in your project
2. You should see a new scenario: **"Delivery Status Lookup"**
3. You should see a new intent: **"Delivery Status Lookup"** (triggered when a user asks about a shipment)

If the scenario is missing, ensure `trackb_setup_scenarios` is set to `True` and re-publish the project.

3.4 Step 4 — Test the Integration

Open the **Newo conversation interface** (chat or voice channel) and test with:

1. **Happy path:** "Where is my package? Tracking number: ABC123" → Agent should respond with the current delivery status from TrackB
2. **Missing tracking number:** "Where is my package?" → Agent should ask the client to provide the tracking number exactly as shown in the shipment confirmation
3. **Unknown tracking number:** Provide a non-existent tracking number → Agent should say there is no information for that tracking number (without guessing)

4. How It Works

4.1 Delivery Status Lookup — End-to-End

1. Customer asks about a delivery
↓
2. ConvoAgent detects the intent
Conditions checked:
 - Tracking number is present in the conversation
 - Agent has explicitly promised to check the status
↓
3. DeliveryStatusFlow activates
 - Extracts the tracking number from the conversation using AI
 - If no valid tracking number → asks user to provide it → stops
↓
4. TrackB API is called
GET `https://track.pasts.lv/api/v1/consignment/tracking?id={tracking_number}`
↓
- 5a. API returns data
 - Agent reports only the facts present in the response
 - No invented statuses or guesses
↓
- 5b. API returns empty / not found
 - Agent says: "No delivery information for this tracking number"
↓
- 5c. API call fails
 - Agent says: "Unable to find delivery information"

4.2 Strict Response Policy

The agent is configured to **never speculate** about delivery status:

- Does **not** say "your package may be delayed" unless the API explicitly says so
- Does **not** say "it seems to be delivered" unless the API explicitly says so
- Only reports what is **explicitly present** in the TrackB API response

This prevents misinformation and maintains customer trust.

FAQ

Q: Does the customer need to provide an API key? A: No. The TrackB integration uses a pre-configured access token. No setup on the TrackB side is required from the customer.

Q: What happens if the customer doesn't say the tracking number? A: The agent will ask them to provide the tracking number exactly as shown in their shipment confirmation. The lookup will not proceed without it.

Q: Can the agent check multiple tracking numbers in one conversation? A: The agent handles one tracking number lookup per conversation turn. For multiple shipments, the customer needs to ask again.

Q: What does "facts only" mean in practice? A: The agent will only read back what the TrackB API explicitly returns — for example, "Your package is in transit, last scanned at Riga sorting facility on March 15." It will never add interpretations like "it looks like it might be delayed."

Q: What if the scenario doesn't appear in the canvas after publishing? A: Check that `trackb_setup_scenarios` is `True` in the attributes. Re-publish the project. If the issue persists, contact support.

Q: Which carrier or postal service does TrackB support? A: TrackB (track.pasts.lv) is a Latvian parcel tracking service. It aggregates tracking data for shipments handled through supported Latvian and regional carriers. For other carriers, a different integration would be needed.
